

1. `<iframe>`
2. Semantically used to contain content that is secondary to the main content. it has no special css out of the box but css can be used to style it
3. Using:

```
<details>
  <summary>item</summary>
  description
</details>
```

4. POST and GET allows access to a form data but get pastes the form content in the URL while POST doesn't
5. This allows the showing of images at certain width breakpoints:

```
if (min-width <= 1000px){
  shows image1
}
else if (min-width <= 750px){
  shows image2
}
else{
  shows image3
}
```
